

# **A Recursive Trust-Region Method for Multi-Scale Unconstrained Minimization: Preliminary Numerical Experience**

Philippe Toint ([philippe.toint@fundp.ac.be](mailto:philippe.toint@fundp.ac.be))

(with S. Gratton and A. Sartenaer)

Department of Mathematics, University of Namur, Namur

# Unconstrained optimization

The unconstrained nonlinear programming problem:

$$\text{minimize } f(x)$$

for  $x \in \mathbb{R}^n$ ,  $f$  smooth.

- Many applications (Annick's talk)

(Generalizations now under study)

# Hierarchy of problem descriptions

Can we use a structure of the form:

Finest problem description

Restriction  $\downarrow R$

$P \uparrow$  Prolongation

Fine problem description

Restriction  $\downarrow R$

$P \uparrow$  Prolongation

...

Restriction  $\downarrow R$

$P \uparrow$  Prolongation

Coarse problem description

Restriction  $\downarrow R$

$P \uparrow$  Prolongation

Coarsest problem description

# Structured model choice

Consider minimizing at **topmost** (finest) level.  
At each iteration, choose the model as

- a local Taylor expansion (classical)  
→ **Taylor iteration**
- the immediately coarser problem description  
→ **recursive iteration:**

compute fine  $g$  (and  $H$ )

step and trial point

**Restriction**  $\downarrow R$

$P \uparrow$  **Prolongation**

minimize the *coarse* model within the *fine* TR

# A recursive multi-scale algorithm

Until **convergence**:

- Choose either a Taylor or recursive model
  - Taylor model: compute a Taylor step
  - Recursive: **apply the Algo recursively**
- Evaluate change in the objective function
- If achieved reduction  $\approx$  predicted reduction,
  - accept trial point as new iterate
  - (possibly) enlarge the trust region
- else
  - reject the trial point
  - shrink the trust region
- Impose: **current TR  $\subseteq$  upper level TR**

# (Simple) Taylor iterations

Which solver for the (approximate) solution of the (same level) **trust-region subproblem**?

Simple answer:

- for **low(est) level(s)** (small dimension):  
the exact Moré-Sorensen method
- for **higher levels** (high dimension):  
a truncated conjugate gradient  
(Steihaug-Toint or GLTR)

But...

# Multigrid technology...

Multigrid techniques for PDE problems indicates:

- the **high-frequency** components of **residual** only visible in **fine mesh** (high levels)
- need **two** different methods:
  - reduce **high frequency** components on the **fine mesh**

Smoothing

- reduce **low frequency** components on the **coarse mesh**

Damping

# ... adapted to optimization

In unconstrained optimization,

residual  $\rightarrow$  gradient

- gradient **smoothing**:
  - TCG not very efficient!
  - adapt Gauss-Seidel smoothing
    - $\rightarrow$  **cyclic coordinate search**
    - (on Taylor's model)
- low frequency **damping**:  
full solution (MS) in low dimension

- Perspectives

# Structure of the recursive iterations

Decision to **stop solving the lower-level subproblem** based on

- subproblem **criticality**  $\rightarrow$  free form (gradient accuracy + TR constraint activity)
- fixed form **cycles** (possibly truncated)
  - **V** cycles
  - **W** cycles
  - **$W_q$**  cycles ( $q > 2$ )

At least one successful iteration per level

For  $i = 0, \dots, r - 1,$

- apply the **recursive algorithm** to solve

$$\min_x f_i(x)$$

(with **increasing accuracy**)

- apply the **prolongation** to obtain the initial point at next level

- reminiscent of the **full multigrid scheme**
- approach of the solution **at coarse levels**

# A minimum surface problem

solution at level 5

$$n = 3^2 = 9$$

$$n = 7^2 = 49$$

$$n = 15^2 = 225$$

$$n = 31^2 = 961$$

$$n = 63^2 = 3969$$

$$n = 127^2 = 16129$$

# Further problem details

- **structured** level transfer operators
  - $P$  = full weighting interpolation operator
  - $R$  = normalized  $P^T$
- handling the **boundary condition**
  - boundary condition not forced
  - additional **smoothing** “just inside”
- random starting point (at coarsest level)

Contact me for a live demo ...

# Other test problems (1)

- 2D Laplacian (check) problem (5 points FD pencil, unit square)

$$\min -\frac{1}{2}x^T \Delta x - f^T x$$

$$f = \sin[x_1 * (1 - x_1)] * \sin[x_2 * (1 - x_2)]$$

- 2D nonconvex quartic nonlinear least-squares (5 points FD pencil, unit square)

$$\min \int (u - f)^2 + 10^{-2} \int (\gamma - f)^2 + \int (-\Delta u + u\gamma - g)^2$$

$$g = -\Delta f + f^2$$

# Other test problems (2)

- Lewis and Nash Dirichlet to Neumann transfer problem:

$$a : [0, \pi] \rightarrow \mathbb{R} \int_0^\pi \left( \frac{\partial u}{\partial x_2}(x_1, 0) - \phi(x_1) \right)^2 dx_1$$

with  $S = \{(x_1, x_2), 0 \leq x_1 \leq \pi, 0 \leq x_2 \leq \pi\}$

$$\Gamma = \{(x_1, x_2), 0 \leq x_1 \leq \pi, x_2 = 0\}.$$

$$\phi(x) = \sum_{i=1}^{15} \sin(i x) + \sin(40 x)$$

subject to the boundary value problem

$$\begin{cases} \Delta u = 0 \\ u(x, y) = a(x_1) \text{ on } \Gamma, \quad u(x, y) = 0 \text{ on } \partial S \setminus \Gamma \end{cases}$$

# Perspectives

Encouraging (so far)

- more numerical experiments!
- second-order convergence theory
- multigrid-type developments:  
(semi-coarsening, algebraic multilevel, ...)
- constrained problems  
(bounds, equalities, general)
- non-monotone (filter) techniques
- ... and much more!

Thank you for your attention
