2 A method for recognizing underlying sparsity

< /□ > < 三

#### Structure and sparsity

### Structure and efficiency

In scientific computations:

Problem structure
$$\Rightarrow$$
Sparse linearization $\Rightarrow$ Efficient computation

Example:

local variables + local interaction  $\rightarrow$  sparsity pattern  $\rightarrow$  efficient factorizations

This talk's objective: explore the  $\implies$  implication in the context of optimization

## Sparsity and optimization

Where is sparsity useful in nonlinear optimization?

unconstrained: Newton's method:

$$H_k \Delta x_k = -\nabla_x f(x_k)$$

with  $H_k \approx \nabla_{xx} f(x_k)$ ;

constrained: KKT system

$$\left(\begin{array}{cc} H_k & A_k^T \\ A_k & 0 \end{array}\right) \left(\begin{array}{c} \Delta x_k \\ \Delta \lambda_k \end{array}\right) = - \left(\begin{array}{c} g(x_k) \\ 0 \end{array}\right)$$

with  $H_k \approx \nabla_{xx} L(x_k, \lambda_k)$ .

• our motivation: (sparse) semi-definite relaxations for polynomial problems

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

## Partially invariance...

### A common structure: partial invariance

$$f(x)$$
 is partially invariant  
 $\overleftarrow{f(x)} = \overline{f}(u)$  with  $u = Ax$  and  $A$  has low rank

$$f(x) \text{ is partially separable} \\ \overleftarrow{\qquad\qquad} \\ f(x) = \sum_{\ell=1}^m f_\ell(x) \text{ where each } f_\ell(x) \text{ is partially invariant}$$

イロト イヨト イヨト イヨ

### ... and useful consequences

If f(x) is partially invariant:

- In range(A) is a subspace ⇒ geometric concept (basis invariant)
- Hessian structure

$$\nabla_{xx}f(x) = A^T \nabla_{uu} \overline{f}(u) A$$

invariant subspace:

$$Inv(f) = \{ w \in \mathbb{R}^n \mid f(x+w) = f(x) \quad \forall x \in \mathbb{R}^n \} = Null(A)$$

induced (Cartesian) sparsity:

$$e_{\ell} \in \operatorname{Inv}(f) \Longrightarrow [\nabla_{xx} f(x)]_{ij} = 0 \text{ for } i = \ell \text{ or } j = \ell$$

(in this case,  $A = \square$ )

Define

$$K(f) = \{\ell \mid e_\ell \in \mathrm{Inv}(f)\}$$

the sparsity index of f

Kim, Kojima, Toint (Seoul, Tokyo, Namur)

< ロ > < 同 > < 回 > < 回 >

Griewank and T. (1981):

f(x) smooth and  $\nabla_{xx}f(x)$  sparse  $\Longrightarrow f(x)$  partially separable

The question is to recognize the underlying sparsity:

Given  $\{f_\ell(x)\}_{\ell \in M}$  a collection of partially invariant functions, is there a basis in which each  $\nabla_{xx} f_\ell(x)$  has few nonzero rows and columns?

More specifically (for sparse SDP relaxations):

Can we choose a basis such that  $\nabla_{xx}\left[\sum_{\ell\in M}f_\ell(x)\right]$  admits a sparse Cholesky factorization?

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

## Sparsity and the basis

The tool of the trade

$$z \rightarrow x = Pz$$
 where  $P = (p_1, \ldots, p_n)$  is nonsingular

We then consider the transformed functions

$$g_\ell(z) = f_\ell(Pz)$$

and the invariant spaces are preserved:

$$\operatorname{Inv}(g_{\ell}) = P^{-1}\operatorname{Inv}(f_{\ell})$$

and

$$K(g_{\ell}) = \{j \mid e_j \in \text{Inv}(g_{\ell})\} = \{j \mid P^{-1}p_j \in \text{Inv}(g_{\ell})\} = \{j \mid p_j \in \text{Inv}(f_{\ell})\}\$$

Thus,

sparsity can be increased by choosing  $p_j$  in (as many as possible) invariant subspaces

< (□) < 三 > (□)

## An example

Consider

$$\min_{x} \sum_{\ell=1}^{n} \left[ x_{\ell}^2 - x_{\ell} \right] + \left[ \sum_{i=1}^{n} x_i \right]^4$$

then

$$Inv(f_{j}) = e_{j}^{\perp} \quad (\ell = 1, ..., n) \text{ and } Inv(f_{n+1}) = e^{\perp}$$
$$K(f_{\ell}) = \{1, ..., n\} \setminus \{\ell\} \quad (\ell = 1, ..., n) \text{ and } K(f_{n+1}) = \emptyset$$

Now choose

$$p_j = e_j - e_{j+1}$$
  $(j = 1, ..., n-1)$  and  $p_n = e_n$ 

and the problem becomes

$$\min_{z} \sum_{\ell=1}^{n} \left[ (z_{\ell} - z_{\ell-1})^2 - (z_{\ell} - z_{\ell-1}) \right] + [z_n]^4$$

Then

 $K(g_{\ell}) = \{1, \dots, n\} \setminus \{\ell - 1, \ell\} \quad (\ell = 1, \dots, n) \text{ and } K(g_{n+1}) = \{1, \dots, n-1\}$ 

the size of  $K(g_{\ell})$  are large evenly

Kim, Kojima, Toint (Seoul, Tokyo, Namur)

Recognizing Underlying Sparsity

### For $S \subseteq \{1, \ldots, m\}$ and let

The idea (1)

 $\operatorname{Inv}[S] = \bigcap_{\ell \in S} \operatorname{Inv}(f_{\ell})$ 

Our objective: choose  $p_j \in Inv[S_j]$  for  $S_j$  as large as possible (j = 1, ..., n).

Let

 $L_{\ell}(S) = \{j \mid \ell \in S_j\}$  (the set of  $p_j$  that are invariant for  $f_{\ell}$ )

Reformulate again:

Can we choose  $p_1, \ldots, p_n$  such that the size of the  $\{L_\ell(S)\}_{\ell=1}^m$  are large evenly?

3

< 日 > < 同 > < 回 > < 回 > < 回 > <

# The idea (2)

Finally (!), for  $S = (S_1, \ldots, S_n)$ , define

 $\sigma(\mathcal{S}) =$  the vector  $(\#L_1(\mathcal{S}), \dots, \#L_m(\mathcal{S}))$  sorted by increasing values

General idea:

lexicographically maximize  $\sigma(\mathcal{S})$ 

subject to the existence of  $p_1, \ldots, p_n$  with  $S_j = \{\ell \mid p_j \in \text{Inv}(f_\ell)\}$ 

- maximization makes the  $L_{\ell}(S)$  large
- the lexicographic maximization make them evenly large

# A sketch of the method

How do we solve that combinatorial problem?

- approximate solution only!
- use a greedy approach:
  - progressively increase the size of the problem (external loop)
  - progressively increase the size of the S<sub>j</sub> (internal loop)
- ensure (almost certain) feasibility in two steps:
  - "weak" feasibility by a (cheap) probabilistic test
  - real feasibility by the structure of the greedy approach

Complicated, but numerically tractable!

Recognizing Underlying Sparsity

### Indefinite quadratics

### Example 2: SDP relaxations of rank 4 indefinite quadratics in the unit cube

n = 10		n	= 30	n = 100	
nnzL	cpu	nnzL	cpu	nnzL	cpu
55 / 46	1.0 / 0.9	465 / 194	3261.9 / 7.3	5050 / 539	∞ / 55.3

## Conclusions

- transformation useful, allowing the solution of previously unsolvable problems
- applications to other areas than SDP relaxation...
- many remaining questions:
  - basis conditioning
  - other measures of sparsity
  - alternative algorithms
  - (efficiency of sparse SDP relaxations)
- ... but this is a first encouraging step!

Thank you for your attention
